UNIT III: SERVER SIDE SCRIPTING

AALIM MUHAMMED SALEGH COLLEGE OF ENGINEERING
DEPARTMENT OF INFORMATION TECHNOLOGY
SEMESTER – V
IT8501 – WEB TECHNOLOGY
UNIT III :SERVER SIDE SCRIPTING

SYLLABUS

- **UNIT III SERVER SIDE SCRIPTING**
- Host Objects: Browsers and the DOM-Introduction to the Document Object Model DOM History and Levels-Intrinsic Event Handling-Modifying Element Style-The Document Tree-DOM Event Handling-Accommodating Noncompliant Browsers Properties of window. Server-Side Programming: Java Servlets- Architecture - Overview-A Servlet-Generating Dynamic Content-Life Cycle- Parameter Data-Sessions-Cookies-URL Rewriting-Other Capabilities-Data Storage Servlets and Concurrency- Databases and Java Servlets.
-
- **Total Topics: 22**
- **CSS : 09 Topics**
- **Javascript: 13 Topics**

SYLLABUS

UNIT III: SERVER SIDE SCRIPTING

- Host Objects: Browsers and the DOM
- Introduction to the Document Object Model
- DOM History and Levels
- Intrinsic Event Handling
- Modifying Element Style
- The Document Tree
- DOM Event Handling
- Accommodating Noncompliant Browsers Properties of window.

- Server-Side Programming: Java Servlets
- Architecture –Overview
- A Servlet-Generating Dynamic Content
- Life Cycle
- Parameter Data
- Sessions
- Cookies
- URL Rewriting
- Other Capabilities: Data Storage
- Servlets and Concurrency
- Databases and Java Servlets.

UNIT III :SERVER SIDE SCRIPTING

SERVER SIDE SCRIPTING

- **Server-side scripting** is a technique used in web development which involves
 - employing scripts on a web server which produces a response customized for each user's (client's) request to the website.
- The alternative is for the web server itself to deliver a static web page.
- Scripts can be written in any of a number of server-side scripting languages.

SERVER SIDE SCRIPTING

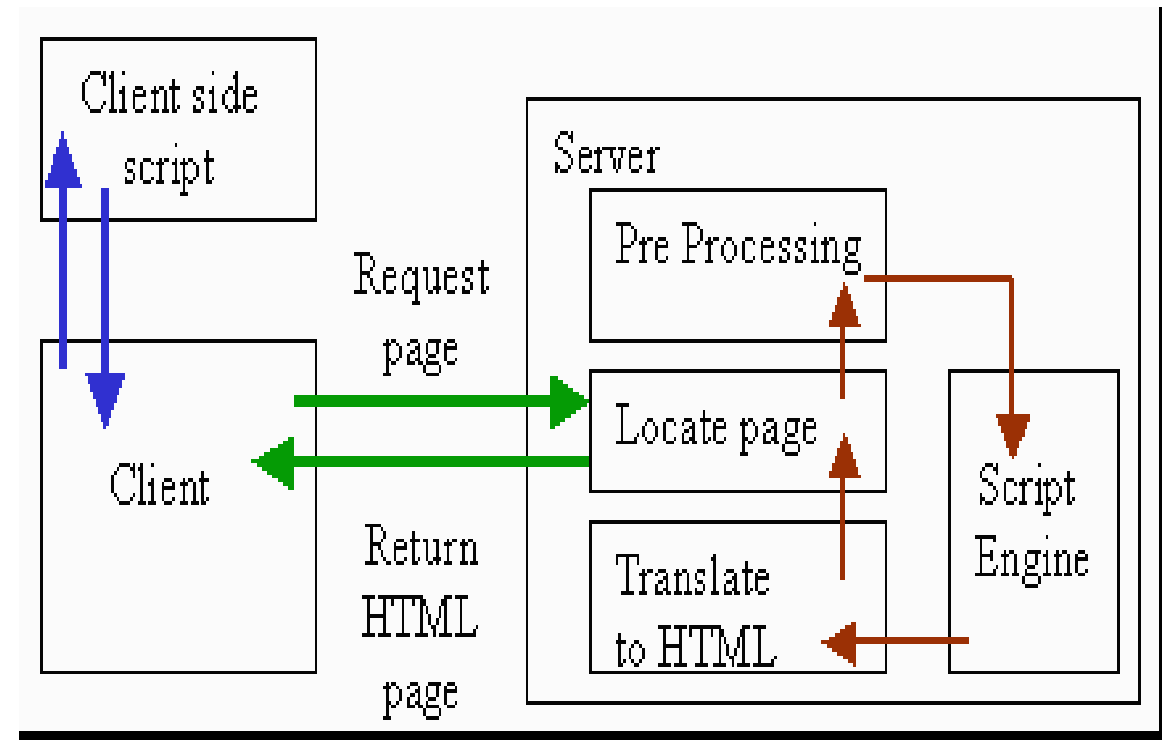

- Server-side scripting is distinguished from client-side scripting
 - where embedded scripts, such as JavaScript, are run client-side in a web browser, but both techniques are often used together.
- Server-side code can be written in any number of programming languages
- Examples of popular server-side web languages include **PHP, Python, Ruby, C#, and JavaScript (NodeJS)**

HOW SERVER SIDE SCRIPTING WORKS?

1. Execution starts at client side with a request to resource.
2. This is submitted to Server.
3. Server response generated .
4. Returns to client side.
5. Client execute the response.

UNIT III :SERVER SIDE SCRIPTING

HOW DOES SERVER SIDE SCRIPTING EXECUTED?

- Server-side scripting is executed on the website's original server before it is sent over to the user's computer.
- Server scripts can respond to queries or searches submitted from
 - HTML forms, access databases and
 - return the result to a browser, and customize a webpage for convenience or user preference.
- It can also be used for security purposes by making it harder for people to look at the site's source code.

UNIT III :SERVER SIDE SCRIPTING

HOW DOES SERVER SIDE SCRIPTING EXECUTED?

- A perfect example of server-side dynamic scripting is the social network site Facebook.
- Any user can edit what goes into their newsfeed, search for friends within a large database, and customize their own profile to fit their personalities.
- Of course, such sites can contain a large amount of personal information so the server-side aspect helps promote the privacy and safety of the information of millions of common users.

UNIT III :SERVER SIDE SCRIPTING

CAPABILITIES OF SERVER SIDE SCRIPTING

- Server-side scripting:
 - often used to provide a customized interface for the user.
 - *assembles client characteristics for use in customizing the response based on those characteristics, the user's requirements, access rights, etc.*
 - enables the website owner to hide the source code that generates the interface, whereas, with client-side scripting, the user has access to all the code received by the client.
 - *supports client needs to make further requests over the network to the server* in order to show new information to the user via the web browser.
